Modbus Introduction

Scope
Thank you for purchasing the model FT2A thermal gas mass flow meter from Fox Thermal. The model FT2A is one of the most technically advanced flow meters in the world. Extensive engineering effort has been invested to deliver advanced features, accuracy measurement performance and outstanding reliability.

This document describes the Modbus implementation using RS485 serial communication physical layer for the Fox Thermal FT2A mass flow meter based on the Modicon Modbus Protocol (PI-MBUS-300 Rev. J).

Modbus Protocol
MODBUS Protocol is an application layer messaging protocol that provides client/sever communications between devices. MODBUS is a request/reply protocol and offers services specified by function codes.

The size of the MODBUS Protocol Data Unit is limited by the size constraint inherited from the first MODBUS implementation on Serial Line network (max. RS485 Application Data Unit = 256 bytes).

Therefore, MODBUS PDU for serial line communication = 256 – Server address (1 byte) – CRC (2 bytes) = 253 bytes.

RS485 ADU = 253 + Server address (1 byte) + CRC (2 bytes) = 256 bytes.

For more information on MODBUS go to the web site http://www.modbus.org/.

Command Request:
  <Meter Address>  <Function code>  <Register start address high>  <Register start address low>  <Register count high>  <Register count low> <CRC high> <CRC low>

Command Response:
  <Meter Address>  <Function code>  <Data byte count>  <Data register high>  <Data register low> ... <Data register high>  <Data register low>  <CRC high> <CRC low>

Note: The data in shown in brackets < > represents one byte of data.
RS485 Wiring: Modbus

**RS485 Wiring for Modbus**

Wiring connections are made to terminal block TS2 for Modbus communication.

The Tx/Rx+ signal connects to pin 7, Tx/Rx- connects to pin 8 and communication common to pin 9 as shown in Figure 3.1.

**Termination Resistor**

Connect a termination resistor across the receive/transmit signals of the last device on the Modbus communication line. To connect the 121 ohm termination resistor on the FT2A, set jumper W1 to the TERM position.

Disconnect the termination resistor on all other external Modbus devices. The termination resistor of the FT2A is disconnected by setting jumper W1 to the NC (Not Connected) position.

*Fig. 3.1: Modbus Wiring*

- Pin 1 of termination resistor header W1
- NC (Termination resistor Not Connected)
- TERM (Termination resistor installed)

---

Note: W1 jumper will either be in the NC or TERM position. It should be in the TERM position on the last meter in the Modbus daisy chain.
FT2A Commands Supported by Modbus

FT2A Commands Supported
The FT2A supports the following commands:

1) Command 03: Read holding registers
2) Command 04: Read input register.
3) Command 06: Preset single register

Read Holding Registers (command 03)
This command reads the basic variable from the FT2A and has the following format:

Request:
   <Meter Address> <Command code=03> <Register start address high> <Register start address low> <Register count high> <Register count low> <CRC high> <CRC low>

Response:
   <Meter Address> <Command code=03> <Byte count> <Data high><Data low> ... <Data high><Data low> <CRC high> <CRC low>

Example:
Request data register at starting address 0x0000 and specifying only 1 register
   <0x01>  <0x03>   <0x00> <0x00> <0x00> <0x01> <0x0a>  <0x84>
Response:
   <0x01>  <0x03>  <0x02>  <xx> <xx> <CRC high> <CRC low>
Where xx xx is the data register value.

* The data in registers with scaling must be multiplied by 10 or 100 as indicated to be scaled properly.

**Note:** Registers A, B & C are provided to get more resolution for low flow and total. When value exceeds the 16 bit registers, they will be frozen with all 16 bits set. It is also possible to use the velocity to calculate the flow in engineering units by using the pipe area and conversion factor for the selected units.
FT2A Commands Supported by Modbus

Read Input Register (FT2A Status, Command 04)
This command is used to report the FT2A status information.

Request:

**Preset Single Register (Command 06)**

This command is used to perform miscellaneous functions such as clearing the totalizer and elapsed time. The register address is Modbus=40018 and the data to write is described below.

**Request:**

```plaintext
<Meter Address> <Command code=06> <Register address high=0x00> <Register address low=0x11> <Register data high=0x00> <Register data low=0x02> <CRC high> <CRC low>
```

**Response:**

```plaintext
<Meter Address> <Command code=06> <Register address=0x00> <Register address=0x11> <Register data=0x00> <Register data=0x02> <CRC high> <CRC low>
```

**Reset Total:**

Address = 40018, data = 0x02
This command is used to clear the Totalizer and elapsed time registers

**Reset 24 hours Total:**

Address=40018, data = 180 (0xB4)
This command reset the 24 hours 7 days record including the day and hours counters

**Reset 24 hour time:**

Address=40018, data = 181 (0xB5)
This command reset the 24 hours day and hours counters
FT2A Commands Supported by Modbus

24 hours Event:

Address=40018, data = 182 (0xB6)

This command generates a 24 hours event, the same way as when the 24 hours counter rolls over.

This may be useful to record total over a shorter period.

Switch to Curve #1:

Address=40018, data = 170 (0xAA)

This command initiates a command to switch to gas curve 1 when configured for 2 gas curves.

Make sure that the input contact is not programmed for curve switching

Switch to Curve #2:

Address=40018, data = 171 (0xAB)

This command initiates a command to switch to gas curve 2 when configured for 2 gas curves.

Make sure that the input contact is not programmed for curve switching
Enter the Programming Mode
Press the F1 or the F2 key repeatedly, in the normal running mode, until the following screen is shown. This enters the programming mode:

Press YES (F4) and then the following screen will prompt the user to enter the password if enabled:

Enter the correct password. Default password for Level 1 is 1234.

Press the UP (F1) or DN (F2) key to select a new digit or character, the cursor points to the selected digit. Press NXT (F3) to select the next digit and OK (F4) to accept the entry.

If the wrong password is entered, the message “Wrong Password” will be displayed for a few seconds and then return to the programming entry screen. If the password is accepted, the following screen will be shown:

This is the base screen for the programming mode. To exit the programming mode, press EXIT (F4) repeatedly until “Normal Mode” is seen briefly.

"57600"
"38400"
"19200"
"9600"
"4800"
"2400"
"1200"

Parity=EVEN

NXT OK

Press NXT (F1) repeatedly until the correct selection is shown and then press OK (F4) to accept the setting.

Selects are:  
“NONE”
“ODD”
“EVEN”

Address=02

CHG OK

Press CHG (F1) to change the address and then press OK (F4) to accept the setting.

Selects are between 01 and 247.

Note: Power cycle is required for the new settings to take effect.
Scope
Thank you for purchasing the model FT2A thermal gas mass flow meter from Fox Thermal. The model FT2A is one of the most technically advanced flow meters in the world. Extensive engineering effort has been invested to deliver advanced features, accuracy measurement performance and outstanding reliability.

This document describes the BACnet MS/TP implementation using RS485 serial communication physical layer for the Fox Thermal FT2A mass flow meter.

BACnet Protocol
BACnet MS/TP (Building Automation and Control Network /Master Slave Token Passing) is a data link layer protocol designed for communication between devices in building automation control systems. The protocol is based on devices, objects, properties, and services. Information inside a BACnet device is organized into a series of objects. Properties allow the data from the object to be written or read. The actions that a BACnet device uses to interact with another device are the services.

The FT2A Device profile: BACnet Smart Sensor (B-SS)

FT2A supports the following device binding methods:

- Receive Who-Is, send I-Am (BIBB DM-DDB-B)
- Receive Who-Has, send I-Have (BIBB DM-DOB-B)

Objects for FT2A:

- Analog Input 1 = Flow
- Analog Input 2 = Gas Temperature
- Analog Input 3 = Total Flow / Reset Total
- Analog Input 4 = Elapsed Time since reset

Device object property identifiers and restrictions: (properties that are writable)

MS/TP baud rates:

9600, 19200, 38400, 57600, 76800, 115200

FT2A Character sets supported:

ANSI X3.4, UTF-8

Fox Thermal BACnet vendor ID: 650

For more information about BACnet visit http://www.bacnet.org/.
**RS485 Wiring: BACnet MS/TP**

Wiring connections are made to terminal block TS2 for BACnet MS/TP communication.

The Tx/Rx+ signal connects to pin 7, Tx/Rx- connects to pin 8 and communication common to pin 9 as shown in Figure 8.1.

**Termination Resistor**

Connect a termination resistor across the receive/transmit signals of the last device on the BACnet MS/TP communication line. To connect the 121 ohm termination resistor on the FT2A, set jumper W1 to the TERM position.

Disconnect the termination resistor on all other external BACnet MS/TP devices. The termination resistor of the FT2A is disconnected by setting jumper W1 to the NC (Not Connected) position.

*Fig. 8.1: BACnet MS/TP Wiring*

Note: W1 jumper will either be in the NC or TERM position. It should be in the TERM position on the last meter in the BACnet MS/TP daisy chain.
BACnet Programming

**Enter the Programming Mode**
Press the F1 or the F2 key repeatedly, in the normal running mode, until the following screen is shown. This enters the programming mode:

```
SET PARAMETERS?
  NO           YES
F1  F2  F3  F4
```

Press YES (F4) and then the following screen will prompt the user to enter the password if enabled:

```
PASWD: _
  UP    DN    NXT    OK
F1  F2  F3  F4
```

Enter the correct password. Default password for Level 1 is 1234.

Press the UP (F1) or DN (F2) key to select a new digit or character, the cursor points to the selected digit. Press NXT (F3) to select the next digit and OK (F4) to accept the entry.

If the wrong password is entered, the message “Wrong Password” will be displayed for a few seconds and then return to the programming entry screen. If the password is accepted, the following screen will be shown:

```
SET PARAMETERS?
  I/O   FLO   DSP   EXIT
F1  F2  F3  F4
```

This is the base screen for the programming mode. To exit the programming mode, press EXIT (F4) repeatedly until “Normal Mode” is seen briefly.
Enter menu by scrolling to display 4 and entering the password

SET PARAMETERS
I/O FLO DSP EXIT

SET I/O
COM I/O 420 EXIT

Comm=BACnet
NXT OK

BACnet

Baud=9600
NXT OK

MAC_ADD=23

BACnet Programming

**Communication Protocol and Parameters**

To program the communication parameters, press I/O (F1) key from the base menu.

```
SET I/O
I/O       FEQ       420     EXIT
F1    F2    F3    F4
```

Then press I/O (F1) again:

```
SET I/O
COM     CTC     EXIT
F1    F2    F3    F4
```

Then press COM (F1) to select communication parameters.

Set Bus protocol for BACnet:

```
Bus=BACnet
NXT     OK
F1    F2    F3    F4
```

Press NXT (F1) repeatedly until BACnet is selected as shown and then press OK (F4) to accept the setting.

```
Baud=9600
NXT     OK
F1    F2    F3    F4
```

Press NXT (F1) repeatedly until the correct selection is shown and then press OK (F4) to accept the setting.

Selections are:  “9600”
“19200”
“38400”
“57600”
“76800”
“115200”

Next select the MS/TP Mac address. The selection is from 0-127. Please note that only one device can be on a MS/TP Mac address.
BACnet Programming

MAC_ADD=23
CHG OK
F1 F2 F3 F4

Next select the MS/TP Max Master. The selection is from 0-127.

MAX_MASTER=127
CHG OK
F1 F2 F3 F4

Next input the device object instance. Selection is from 0-4194303.

ID=12531
CHG OK
F1 F2 F3 F4

Next enter the device object name (9 characters maximum).

NAME=FT2A_FLOW
CHG OK
F1 F2 F3 F4

Note: Power cycle is required for the new settings to take effect.
